A Key to Important Diseases of Common Deciduous Kentucky Landscape and Forest Trees

John R. Hartman¹, Jody M. Thompson², Julie W. Beale³ and Sara J. Long³

Instructions: Select the tree that you are examining from the following choices. After selecting the appropriate tree, choose from the disease descriptions listed below the selected tree. Choose the description that most closely matches what you see on the tree.

Ash

color with gray areas. Botryosphaeria canker

- Cherry
 - 1) Signs or symptoms on the foliage: Leaflets with small, circular brown to black spots; may cause leaves to turn yellow and fall prematurely. Cherry leaf spot
 - 2) Signs or symptoms on twigs and branches: Twigs and branches with large lumpy black swellings; (Found mainly on flowering *Prunus* spp., i.e., flowering cherry, flowering plum, etc.)

 Black knot

Crabapple

- 3) Signs or symptoms on leaves, fruits, and shoots: Leaves with circular reddish-orange spots; shoot tips swollen with roughened growth on the swollen areas; fruits with roughened orange lesion, usually on the calyx end. Cedar-apple and -quince rust
- 4) Signs or symptoms on twigs or branches: In spring and early summer branch tips die and are bent over with blackened, dead leaves (crabapple, flowering pear). Fire blight

Dogwood

²Forest Health Specialist, Kentucky Division of Forestry, jody.thompson@ky.gov

³Plant Disease Diagnosticians, University of Kentucky.

1) Signs or symptoms on the foliage: In springtime, purple to brown dead blotches generally along leaf veins, or sometimes as isolated leaf spots or along the leaf margin. 2) Signs or symptoms on the foliage: In summer, leaves may yellow somewhat or develop purple blotches. Newest leaves develop a white, powdery growth on the leaf and shoot surface. Later, leaves may be drooped faded, and curled. Powdery Mildew 3) Signs or symptoms on the lower trunk and roots: Tree declining and dying, loosened bark may be observed at the base of the tree. Cutting into the lower trunk may reveal reddish brown staining under the bark in the root collar region. If roots are dug up and examined, they may appear dark and decayed. Phytophthora root rot Elm 1) Symptoms at first on isolated branches: Branches, dying or dead with curled yellow or brown leaves, often on one side of the tree. Disease may spread to other parts of the tree, eventually killing the entire tree. Examination of wood of affected branches reveals a dark brown staining of the wood. Dutch elm disease 2) Symptoms on the trunk or large limbs: Bark with a water soaked streak due to wetness exuding from a wound, bark sometimes bleached, often a slimy pink, yellow, or whitish matrix is associated with the wetness. Bacterial wetwood 3) Symptom generally affects the whole tree: Tree fades to yellow and eventually dies. Examination of wood of affected branches reveals light brown staining under the bark. Elm yellows Magnolia 1) Symptoms on foliage: White powdery growth develops on leaf surface during summertime. Powdery mildew 2) Symptoms on foliage: In winter or early spring, leaf edges of evergreen magnolia leaves turn brownWinter drying Maple 1) Symptoms on foliage: Leaves with dark brown spots and blotches appearing in springtime. See description under Dogwood. Anthracnose 2) Symptoms on foliage: In summer, black, slightly raised somewhat circular spots develop 3) Symptoms on foliage: In late summer, leaves show marginal leaf burning. See description under Oak. Bacterial leaf scorch 4) Symptoms on limbs or branches: Leaves on individual branches or limbs, often on one side of the tree, turn brown and die. Branch and limb dieback may continue until after a few months or a year the entire tree may die. Cuts made into the wood of affected limbs reveals streaks of a dark, greenish black stain. Verticillium wilt

oun	
1)	Symptoms on foliage: Leaves with brown spots and blotches, often along the veins,
2)	appearing in springtime. See description under Dogwood
,	spot or dead areas may develop in yellowed leaves
3)	Symptoms on foliage: In late summer, leaves on individual branches or limbs show marginal burning or scorch. The following spring foliage has normal green color, but
	scorch symptoms appear again in late summer and affect a few more branches. After
	several years, late summer scorch appears in the entire tree and twigs and branches begin to die back. After 10 to 15 years the tree may have so many dead limbs that the tree
4)	needs to be removed
4)	Symptoms on limbs or branches: Smooth, dark gray patches may develop where on affected limbs, trunk, or branches of declining trees
Redbud	
1)	Symptoms on limbs or branches: In summer, all the leaves on a portion of a single
	branch suddenly turn brown. Close examination of the region where the dead branch part
	meets with the still live branch part may reveal a sunken canker. By peeling back the bark in that region, the creamy white live tissue can be contrasted with the brown, dead
	tissue. This disease may also appear on the trunk, often associated with Pruning activity
	or wounds from prior years Botryosphaeria canker
2)	Symptoms on limbs or branches: Leaves on individual branches or limbs, often on one
	side of the tree, turn brown and die. See description under maple. Verticillium wilt
	Verticinum wit
Sycamore	
1)	Symptoms on foliage: Leaves with brown spots and blotches in springtime. Tree may appear defoliated in spring, especially in the lower canopy, but re-foliates in summer.
	See description under Dogwood
2)	Symptoms on foliage: In late summer, leaves on individual branches or limbs show
	marginal burning or scorch. Over several years, branches and limbs may die back. See
	description under Oak Bacterial leaf scorch
Tulip Poplar	
1)	Symptoms on foliage: General yellowing of foliage in the tree and premature leaf fall
2)	often appearing in late summer Physiological response to dry weather Symptoms on limbs or branches: All of the leaves on individual branches or limbs wilt,
2)	turn brown and die, often just on one side of the tree. See description under Maple.

...... Verticillium wilt

Trees, general

- 1) Signs appear on twigs, branches or trunk: Greenish gray growth on bark surface which may appear crusty or may be growing flat on the bark. Lichens

This Key addresses only the most common diseases of several common Kentucky trees. There are many additional diseases of these trees that occur less frequently than those listed, or that might require microscopic examination or laboratory tests. To confirm your field diagnosis, contact your County Extension Office. Extension agents with trees needing additional tests are backed up by the U.K. Plant Disease Diagnostic Laboratory. The following links may be helpful for learning to recognize tree diseases in more detail.
